President's MESSAGE

HVAC 101

Do you know what the most important part of an HVAC system is?
The most important part is how it is put in.

Most often the low bidder wins the job, and they skip corners when it comes to HVAC system installation; causing your home or office to suffer with poor comfort, efficiency, and safety levels for decades.

To give you the lowest bid, quality and expertise gets thrown out the window. First, the duct system layout and installation will be below industry standards, then professional mechanical equipment, parts and supplies installation are next on the list.

Support after installation is important to ensure you have the best preventive maintenance, and quick repairs when needed. **Low bidders rarely, if ever, offer ongoing support.**

When you turn to the experts at Leggett you get the value-added engineering, knowledge and expertise required to ensure proper equipment size and installation, maintenance, and repairs that matters most.

From solutions to pricing, then scheduling and everything in between, we're up front and transparent about all our processes that will lead to our industry's best 100% satisfaction warranty. So, when you call, we'll always answer; and when you need us, we will always be there for you. **Put our combined 200-plus years of experience and expertise to proper use and trust The Experts at Leggett, Inc.** to make your home comfortable, and keep your plumbing and water heating systems working all year 'round. We hope that we hear from you soon.

I'm so proud of Leggett Inc. and our local, family-owned team, celebrating 56 years of customer service to the greater Harrisburg area. We have been blessed over so many years to have such a loyal team that you can always rely on.

Sincerely yours,

Ernie

Cut Carbon and Save!

What can you do to help reduce your carbon footprint, and save money?

- Did you know that CO₂ emissions from building operations are responsible for about 30% of our total usage annually? So, while you think about the miles per gallon your car uses, you should to also think about what you can do at home. Leggett Inc. can sure help with energy efficient HVAC and water heating equipment.

- Do you know what the carbon footprint is of a bottle of water? Processing resins and product transport contribute to each bottle's carbon footprint in a major way. Leggett Inc. recommends and installs a 4" x 20" carbon filter installed in the main water line, to reduce the taste and odor from most common municipal water systems.

You'll be able to drink fresh, delicious water from any tap in your home or office, saving you lots of money and lowering your carbon footprint forever.

- Properly air sealing your building's envelope, along with proper insulation is one of the best ways to save energy. We recommend BPI certified guidance to be safe.

- Shopping local is the best thing you can do, so please consider it all the time.

Thank you for making a difference. We are here to help you lower your carbon footprint and GHG emissions in any way we can.

Learn from Last Heating Season... Is it Time to Upgrade Your Heating Equipment?

With another heating season behind us, you now have the chance to evaluate your comfort during the winter! Was your home a warm shelter from the bitter cold, or did your heating system not live up to expectations? If it's the latter, a new heating system will help!

We offer the best solutions for your home or office system upgrade, custom built just for you.

Here are some things to consider when evaluating your heating system:

YOUR HEATING SYSTEM'S AGE

After a decade of reliable service, your heating equipment can start to negatively affect your comfort and your bank account – and that's when it's time to consider an upgrade. Did you use more energy, whether fuel or electricity last winter than in years past? Was it a struggle to keep your home warm? These are telltale signs of aging heating equipment!

YOUR HEATING SYSTEM'S EFFICIENCY RATING

Efficiency ratings show how well a new heating system converts energy to heat. Modern heating systems boast efficiency ratings as high as 90% - some going even higher. If your heating equipment is old or has a low efficiency rating, it could be causing higher energy bills than necessary.

YOUR HEATING SYSTEM'S SIZE

Your equipment should be based on the square footage, layout and air flow in your home. Maybe you've had a recent renovation, or you've been tolerating an improperly sized heating system without realizing there was a solution. If a system is too small or too large, it can waste energy and create uneven temperatures from room to room.

If you were unhappy with your comfort levels last winter, give us a call today. We'll help you find a modern, high-efficiency heating system that keeps you warmer while using less energy.

The Reality of Supply Shortages

Right now, we have ample supplies of parts and equipment to handle most repairs and new equipment requests. But, you've seen all the news reports – and we want you to know that supply chain shortages may affect our equipment and parts supply in the coming months.

With this in mind, don't hold off on equipment upgrades or service! Of course, we are doing everything in our power to make sure we keep our warehouses stocked, but with ongoing supply chain disruptions, it could become more difficult to purchase new heating or cooling equipment as time passes.

Give us a call today to discuss your heating or cooling equipment needs.

Go Ductless and Enjoy the View!

Are you tired of blocking your view with window air conditioners? Have you been told your house isn't a candidate for central air? Think again, and talk to us about ductless mini-split air conditioning systems!

Ductless mini-split systems from leading manufacturers could be the solution. Here are a few reasons why!

- **Ideal Installation** – These systems use thin tubing to distribute the cooled air, not big ducts. They can be installed in virtually any house – even those that can't accommodate new ductwork. They are also great options for home additions, converted garages, and dormers or to add cooling to that “hot room” at the back of your house.
- **Excellent Efficiency** – Ductless mini-splits boast high efficiency ratings – much better than window units – so you'll use less energy. Many mini-splits can also provide supplemental heating, and can help lower your cold-weather energy bills.
- **Comfort Control** – With a mini-split, each unit is controlled separately so everyone can keep their rooms at “just right” temperatures.
- **Minimal Maintenance** – All comfort systems need to be checked annually and have their filters changed regularly, but with a mini-split, duct cleaning, vacuuming and other maintenance are needed less frequently.

Whether you're looking for a whole-home solution or your home comfort systems just need a little help, a ductless mini-split might be perfect for you! Give us a call or contact us online to start discussing your options.

It's Not the Heat, It's the Humidity!

Your air conditioning system does more than just blow cold air into the home, it pulls excess moisture out to balance humidity levels and help you feel cooler during the summer. Are you struggling with indoor humidity?

Getting a New Central Air System? Make Sure It's Installed the Right Way!

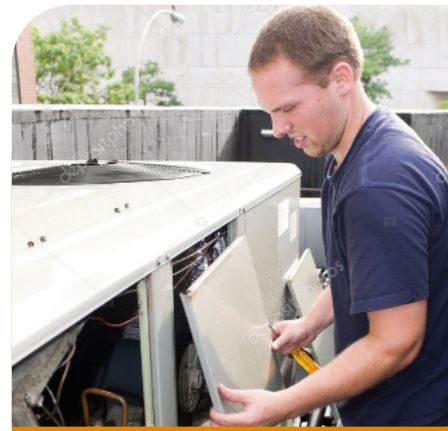

There are a lot of reasons to get a new central air conditioning system, and to do it now. Your new cooling equipment will use less electricity, reduce indoor humidity and keep your whole house cooler.

Cooler homes, lower bills and less humidity are all good things. **Don't throw it all away by investing in a new air conditioning system and then letting the wrong people install it!** You want your installation completed by professionals who are trained by the manufacturer to deliver the highest levels of comfort and efficiency.

Let's take a look at how an installation done right makes a big difference in your comfort:

- **Manageable Utility Costs.** Your new central air system is going to be more efficient than an older one, and a lot more efficient than window or wall units running in every room. You'll use less electricity and enjoy lower utility bills.
- **Fewer Repairs & Service Calls.** A new, properly installed central air conditioning system should not need regular repairs or service – and if there are any problems, those should be covered by the manufacturer warranty and our service plan.
- **Better Indoor Air Quality.** When your air conditioner and ductwork are installed correctly, there are fewer ways for dust and dirt to get into the ducts and spread throughout your home.
- **Better Comfort Coverage.** If dirt and dust can't get into your ductwork, conditioned air can't leak out, so you get better air flow. Combine optimal air flow with properly placed vents to get every corner of the house cool – even those former hot spots.

With all of these factors in mind, don't trust anyone else to install your new central air conditioner. We work closely with the manufacturers to get you the best value, service and installation! Call or contact us to learn more about our central air conditioning options.

Start a New Career in the New Year!

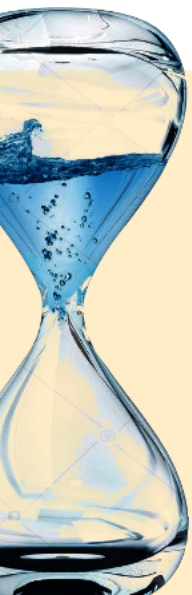

Interested in trying something new this year? Do you have an aptitude for all things mechanical or great people skills? Then you may have what it takes to build a career with us!

Our philosophy is to service the community by offering the best solutions to each client's needs, and by being honest and upfront with everything we do. That philosophy holds true to our employees, too. Wages and compensation are always based on merit, and our benefit package will match or surpass most others. Please give us a call if you're looking for a fresh start – we'd love to have you on our team!

Here are some signs that your AC might not be handling the humidity properly:

- Mold growth that could cause respiratory irritation, asthma attacks and other illnesses
- Damage to wooden floors, furniture, and the structure of a home
- Not feeling cool no matter how high you turn up the AC (and raise your utility bills)
- Infestation of bugs and small animals that thrive in humid conditions
- Damage to expensive electronic devices such as cellphones, computers and televisions

A new air conditioning or air quality system will do a much better job at managing the moisture in your home and they help you save energy to boot!
